Logic & Notes

- basically ig 2sum ki trh he ye
- target = 1, 2, 4,, 2^{21}
- $2^{21} = 2^{20} + 2^{20}$ from constraints

```
class Solution {
public:

    const int MOD = 1e9+7;
    int countPairs(vector<int>& deliciousness) {

        // basically ig 2sum ki trh he ye
        // target=1,2,4,.....,2^21
        // 2^21=2^20+2^20 from constraints

        unordered_map<int, int> mp;
        long long ans = 0;
        for(int n : deliciousness){
            for(int target = 1; target <= 1<<21; target <= 1){
                int rem = target - n;
```

```
        if(mp.count(rem)){
            ans = (ans + mp[rem]) % MOD;
        }

        mp[n]++; // for future elements
    }

    return ans;
}

};
```
