## Concept & Logic Explanation

📌 **very easy**

📌 **case 1:** all even -> return true

📌 **case 2:** all odd -> return true

📌 **case 3:** some even some odd -> [2,4,7,3]

📌 now even-odd is always odd hence 2 and 4 can be converted to odd

📌 since all odd now hence true;

## Implementation

```
class Solution {
public:
    bool uniformArray(vector<int>& nums1) {

        //very easy
        //case 1: all even -> return true
        //case 2: all odd -> return true

        //case 3: some even some odd -> [2,4,7,3]
        //now even-odd is always odd hence 2 and 4 can be converted to odd
        //since all odd now hence true;
        return true;
    }
};
```
