

LC 1176: Diet Plan Performance

Question 165

| Problem Context

let aadya track calories eaten each day:

calories	[1, 2, 3, 4, 5]
k (window size)	2
lower limit	3
upper limit	6

| Dry Run & Point Rules

so for every 2 days:

[1, 2] → **3**

[2, 3] → **5**

[3, 4] → **7**

[4, 5] → **9**

Point Updates:

If $\text{sum} < \text{lower}$ → **-1 point**

If $\text{sum} > \text{upper}$ → **+1 point**

Else → **0 point**

| Approach 1: Standard Fixed Window Size Template

```
for (int i = 0; i < k; i++) { windowSum += calories[i]; //  
3 } if (windowSum < lower) points--; else if (windowSum >  
upper) points++; for (int j = k; j < n; j++) { windowSum  
+= calories[j]; windowSum -= calories[j - k]; // update  
point accordingly } return points;
```
