Problem Statement

We need to return an array, such that $\text{ans}[i]$ is the number of days we have to wait such that after the i -th day we get a warmer temperature.

Dry Run & Examples

Input: [73, 74, 75, 71, 69, 72, 76, 73]

Output: [1, 1, 4, 2, 1, 1, 0, 0]

Core Intuition / Logic

We just need to find the **Next Greater Element** and then subtract its index with our current index.

Note on Stack: The stack stores the indices of days for which a warmer day has *not yet been found*.

C++ Implementation

```
class Solution {  
public:
```

```
vector<int> dailyTemperatures(vector<int>& temp) {  
    int n = temp.size();  
    vector<int> ans(n, 0);  
  
    stack<int> st; // this will store indices of those whose next  
warmer day isn't found yet  
  
    for(int i = 0; i < n; i++) {  
        while(!st.empty() && temp[st.top()] < temp[i]) {  
            ans[st.top()] = i - st.top();  
            st.pop();  
        }  
  
        st.push(i);  
    }  
  
    return ans;  
}
```
